

## Public Pension Plan Health Check: SACRS vs. The Nation

May 16, 2025

Graham Schmidt

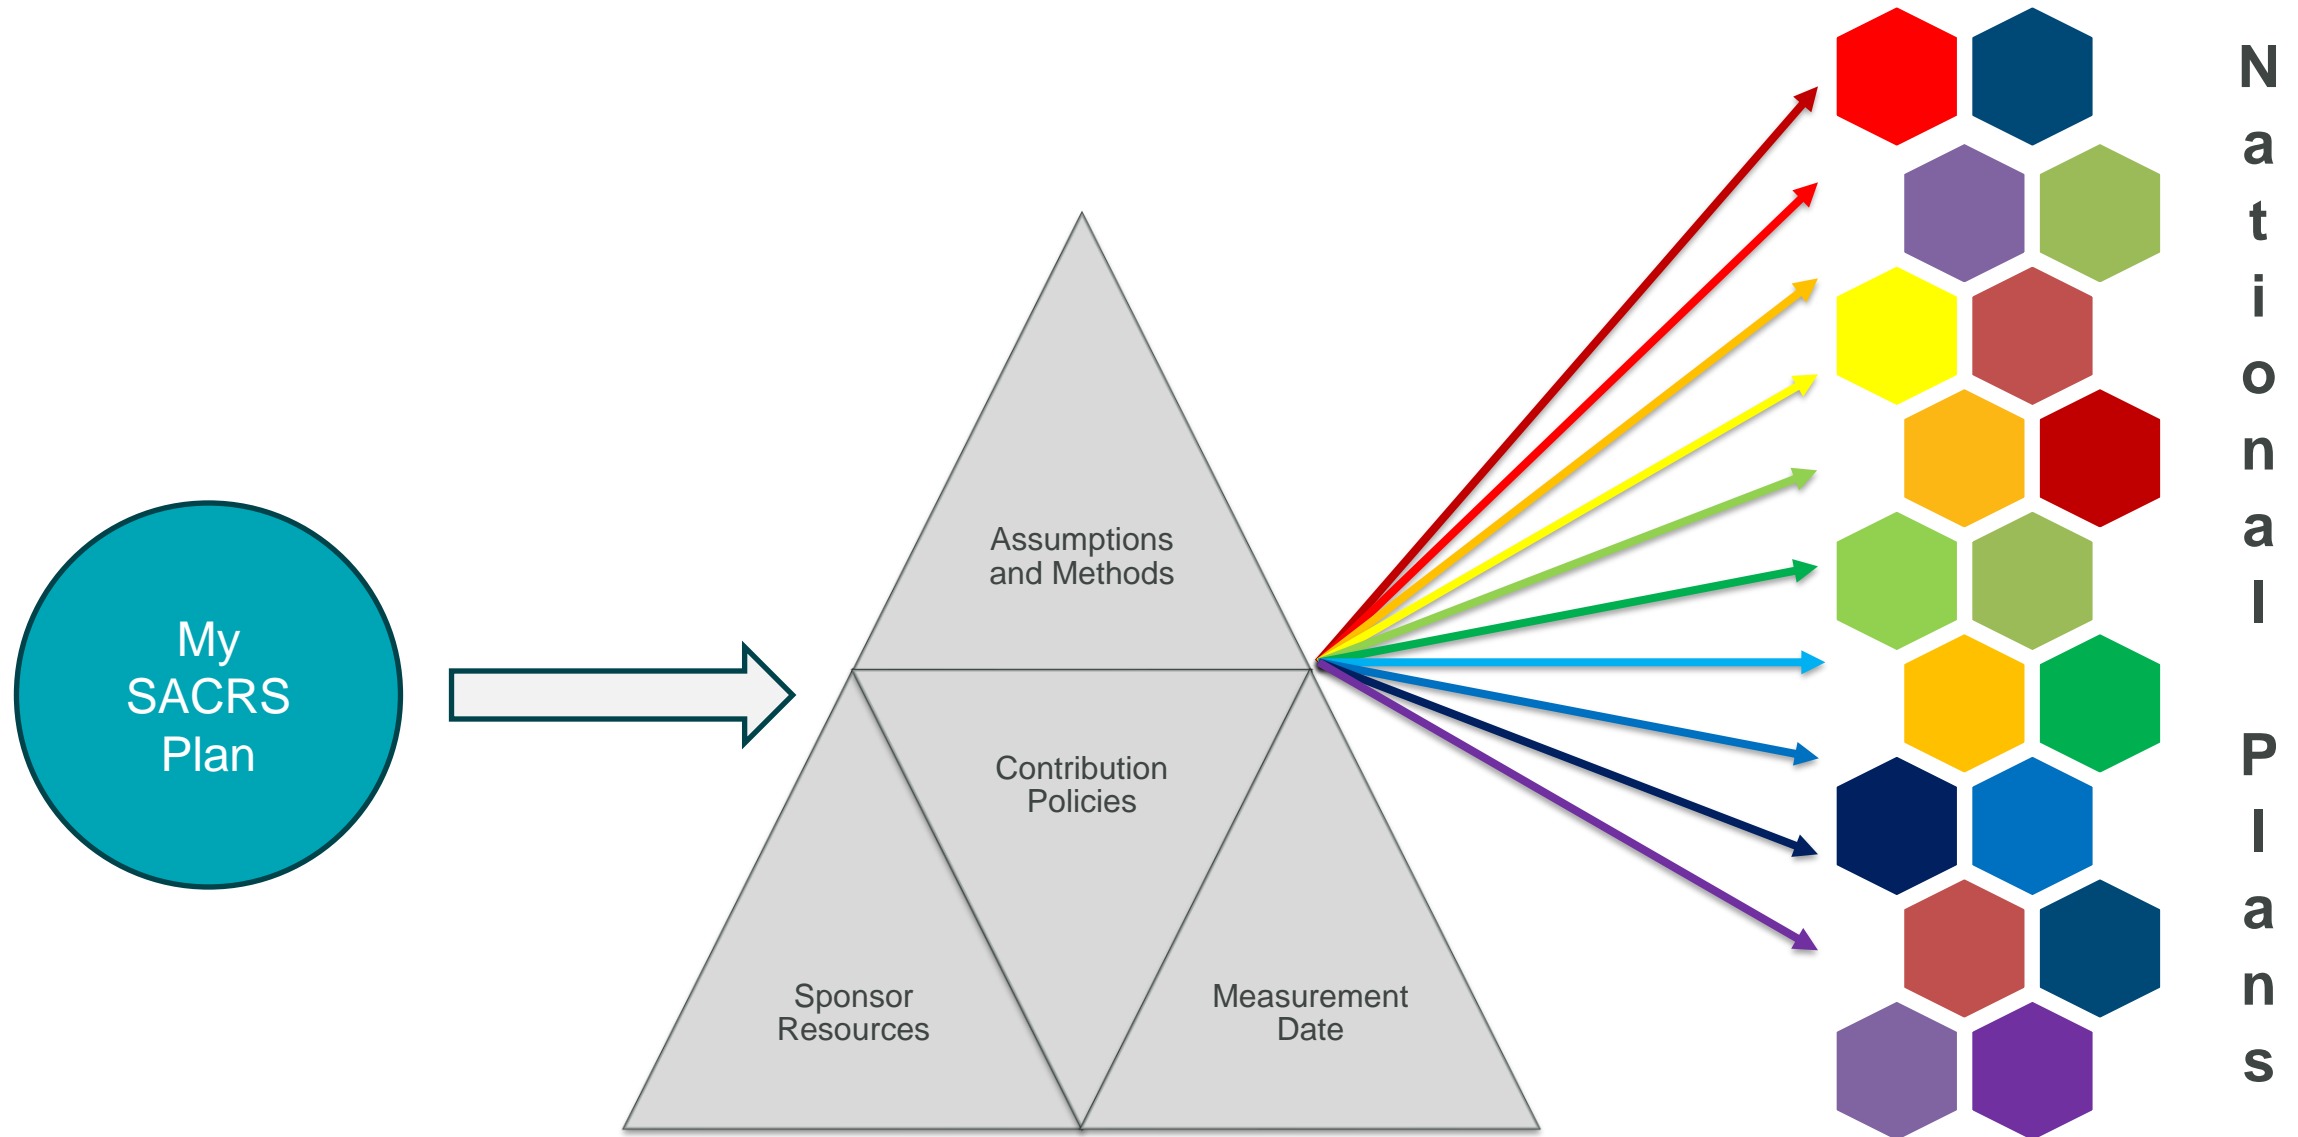

Bill Hallmark

# What Makes a Plan Healthy?

# Comparing Plans – The Challenge

# Funding Progress

# Funded Ratios: SACRS v. Nation

## Funded Ratios Based on Market Assets

Blue dots = SACRS plans

Click arrow or drag slider to scroll through the years  2023

# Comparing Funded Ratios

## Assets

- Actuarial Value vs. Market Value
- Treatment of non-valuation reserves

## Actuarial Liability

- Discount rates
- Actuarial cost method
- Other assumptions

- Funded ratios are the most common metric used to compare plans and assess health
- Differences in how funded ratios are measured can make comparisons misleading

# Funded Ratio Comparisons Can Be Misleading

## Comparison of Funded Ratios

- Issues that may create misleading comparisons:
  - ✓ Different Discount Rates
  - ✓ Different methods to smooth assets
  - ✓ Different actuarial cost methods
  - ✓ Different measurement dates
  - ✓ Different data sources – actuarial valuation versus ACFR
  - ✓ Non-valuation reserves
  - ✓ Non-pension plan debt from POBs
  - ✓ Retiree health assets
- Imperfect solutions
  - ✓ Normalize to common discount rate
  - ✓ Using market value eliminates differences due to asset smoothing methods
  - ✓ Actuarial value constrains differences due to measurement dates

# 2013 to 2023: A Lost Decade in Pension Funding?

## Median Public Plan Funded Ratios Based on the Market Value of Assets

■ National ■ SACRS

# 2013 to 2023: Not a Lost Decade

## Median Public Plan Discount Rate and Funded Ratio

# 2013 to 2023: Not A Lost Decade!

## Median Public Plan Funded Ratios at 7.0% Discount Rate Based on the Market Value of Assets

■ National ■ SACRS

# Funded Ratios – Distribution and Changes

2023 Funded Ratio By Plan  
Based on Market Assets

All

Reported

Adjusted to 7%

Adjusted to 7%

Group ● SACRS ● National

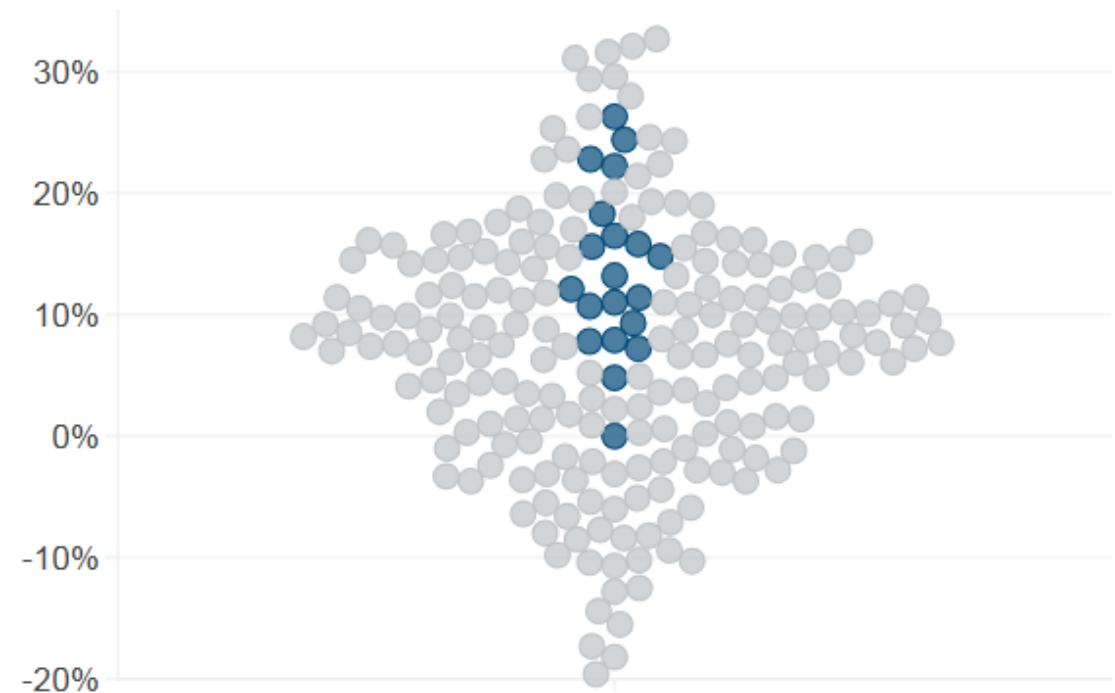

Change in Funded Ratio By Plan From 2013 to 2023  
Based on Market Assets

All

Reported

Adjusted to 7%

Adjusted to 7%

Group ● SACRS ● National

- Funded ratios provide some important information
  - Current assets compared to funding target
  - Progress over time toward funding target
- Funded ratios provide no information related to the sustainability of the plan
  - Cost or affordability of unfunded liability
  - Commitment through contribution policy to fund plan
  - Affordability of risks borne by plan

# Use Interest Cost to Assess Affordability of UAL

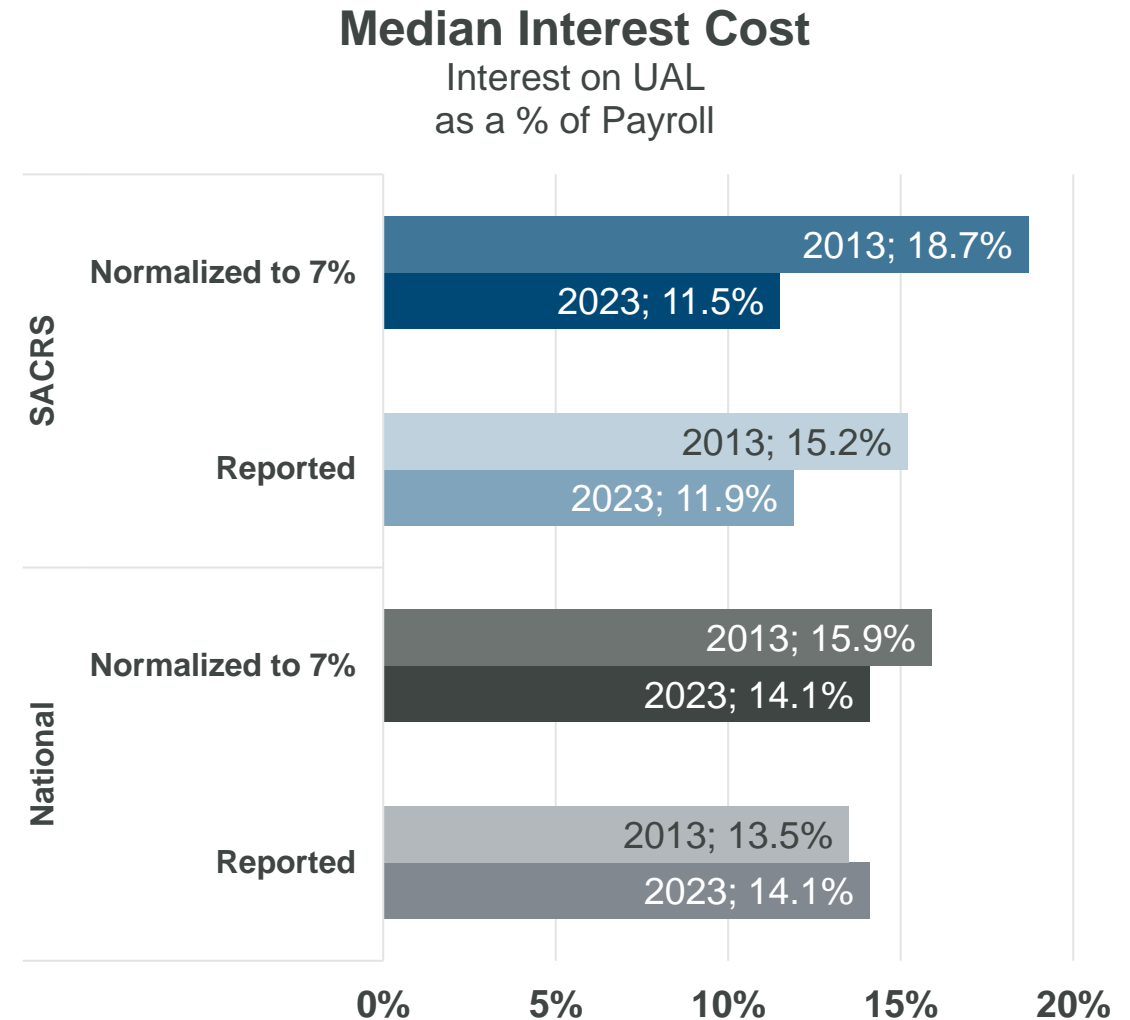

- Interest Cost = Interest on UAL as a Percent of Payroll
  - Cost of maintaining UAL as a dollar amount
  - Expressed as a percent of payroll to assess affordability
    - Payroll is used as a proxy to scale for the resources available from the sponsor
- Differences due to discount rate are somewhat muted
  - A higher discount rate produces a smaller UAL but a larger interest charge

Sample Calculation of Interest Cost			
		As Reported	Normalized
1.	Discount Rate	7.50%	7.00%
2.	Actuarial Liability	\$ 2,500	\$ 2,670
3.	Assets	<u>\$ 1,750</u>	<u>\$ 1,750</u>
4.	<b>UAL (2) – (3)</b>	<b>\$ 750</b>	<b>\$ 920</b>
5.	Funded Ratio (3) ÷ (2)	70.0%	65.5%
6.	Interest on UAL (1) X (4)	\$ 56	\$ 64
7.	Payroll	\$ 350	\$ 350
8.	<b>Interest Cost (6) ÷ (7)</b>	<b>16.0%</b>	<b>18.3%</b>

# Median Interest Cost – Historical Review

Like the Funded Ratio, the improvement on Interest Cost over the last 10 years can be masked by changing assumptions that reflect updated expectations

# Interest Cost Varies For a Given Funded Ratio

## 2023 Funded Ratio vs. Interest Cost

Funded Ratio

# Contribution Policies

# Background – Contribution Policies

# Total Contribution Rates Have Increased

- Total Contribution = contributions from all sources (employee, employer, state, etc.)
- Increases over the last 20 years attributable to:
  - Market returns (2000-2002, 2008)
  - Assumption changes
  - Focus on paying down UAL
- Although total contribution rates have increased, this does not speak to the sufficiency of the contribution

# Tread Water Contribution Benchmark

Total Normal  
Cost\*

Interest Cost

Tread Water Benchmark

\* Includes administrative expenses.

- The Tread Water Benchmark is the contribution rate at which the UAL would remain the same dollar amount if all assumptions are exactly met
- Based on the market value of assets
  - Can vary significantly from year to year
- Ideally, actual contributions exceed the Tread Water Benchmark in most years
  - Not likely every year since the benchmark is based on the market value of assets

# Total Normal Cost Rates Have Increased, But ...

- Total Normal Cost Rates increased over the last 20 years
- However, after adjusting to a constant discount rate of 7.0%, Total Normal Cost Rates have actually decreased
  - Mortality and other assumption changes likely mean the reduction was even greater
- Many plans only reduced benefits for new tiers, so this trend may continue

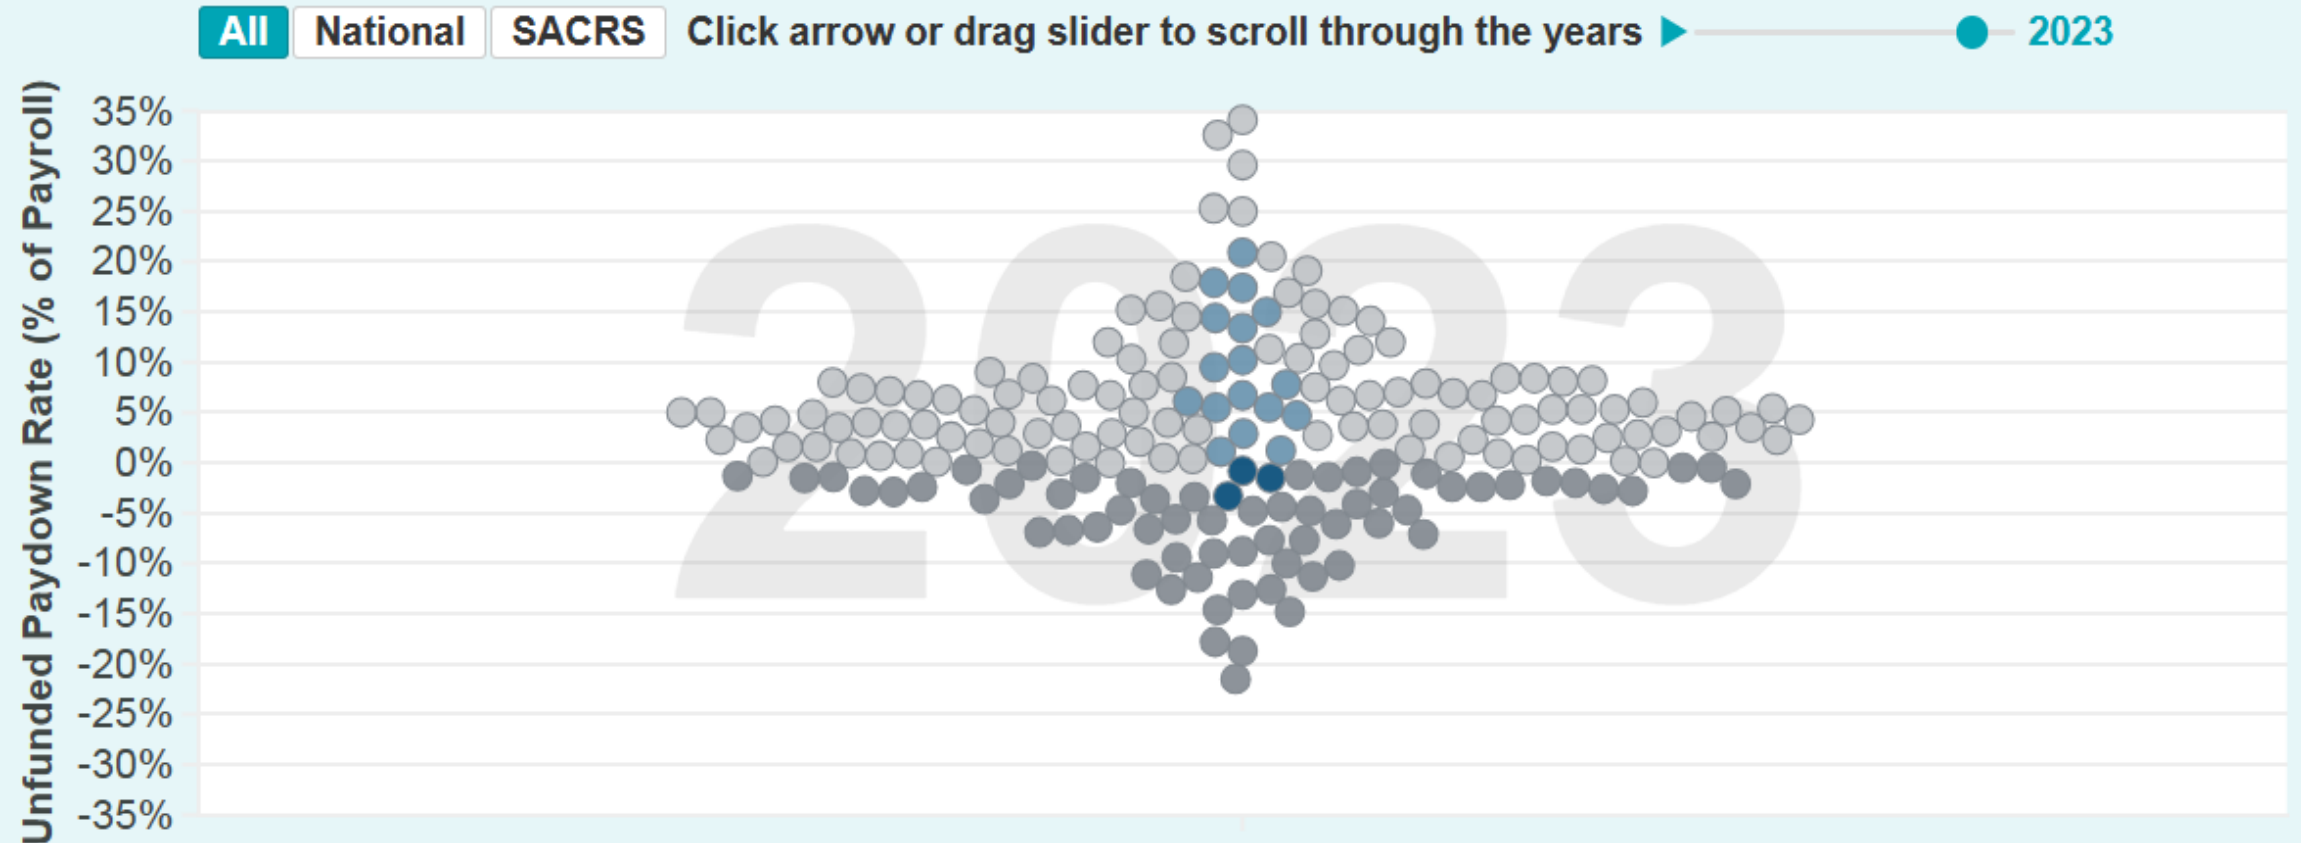

# Contributions Versus Tread Water Benchmark

## Unfunded Paydown Rates

Total Contribution Rate - Tread Water Benchmark

Blue dots = SACRS plans. Darker color is negative.

# What Leads to Contributions Less Than Tread Water?

- Temporary causes
  - Asset smoothing
  - Delay between valuation date and effective date of contributions
- Long-term causes
  - Inadequate fixed-rate contribution
  - Long amortization periods with high amortization payment growth rates
- Actuaries have been working with their clients to eliminate the long-term causes by moving toward
  - Layered amortizations
  - 15 to 20-year periods for gains/losses
  - Lower amortization payment growth rates

Percentage of Plans With Contributions Greater Than Tread Water

# UAL Change vs. Tread Water Benchmark

## Average Paydown Rates vs. Change in UAL (2013-2023)

Plan Colors Vary By Quadrant  
SACRS Plans are Blue, Teal, and Purple

- Key factors that influence the growth or decline in UAL
  - Investment returns
  - Changes in discount rate
  - Contributions
  - Other assumption changes or gains/losses
- Very few plans reduce their UAL if contributions do not exceed the Tread Water Benchmark on average

# UAL Amortization Periods

- Amortization periods have decreased over the last 20 years
- Shorter amortization periods result in:
  - ✓ Less negative amortization
  - ✓ UAL is paid off more quickly
  - ✓ More likely for the contribution to exceed tread water

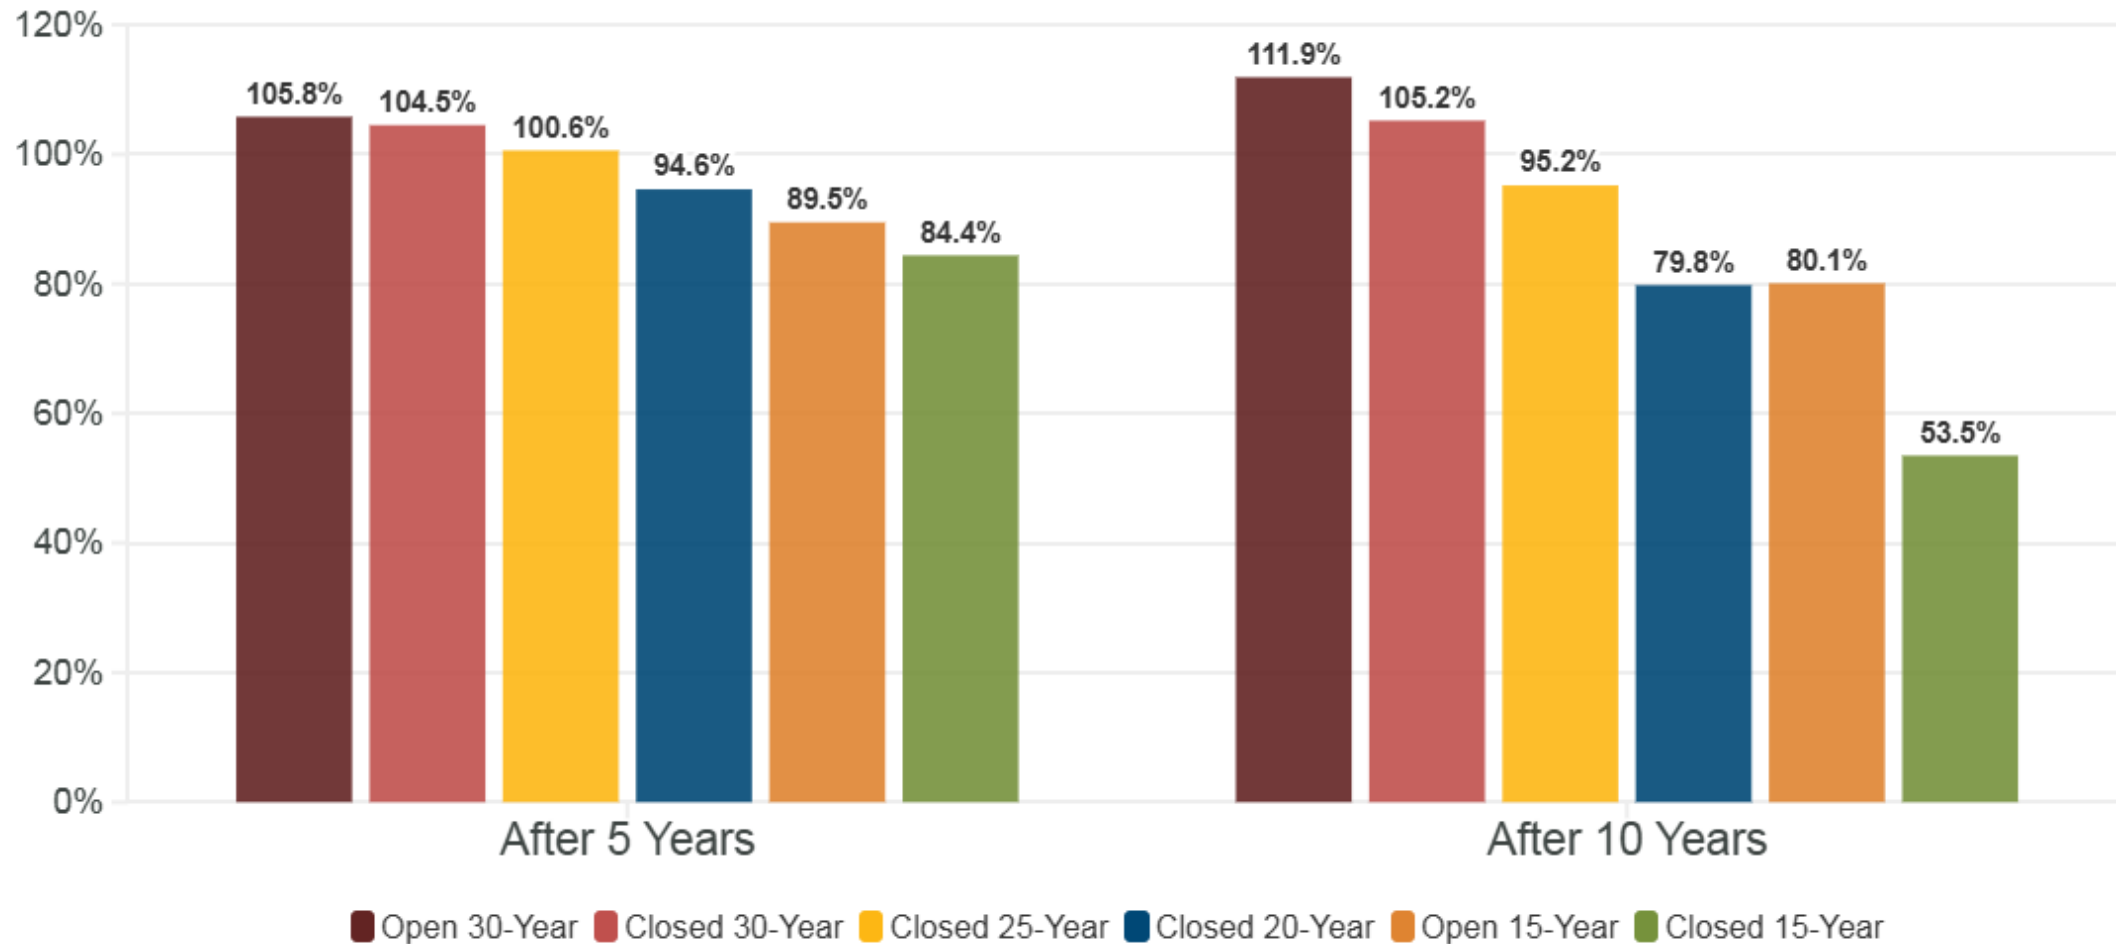

NASRA Amortization Period Survey\*

# Contribution Policies - Amortization of UAL

Percentage of UAL Remaining After 5 and 10 Years of Amortization

# Sensitivity to Risk

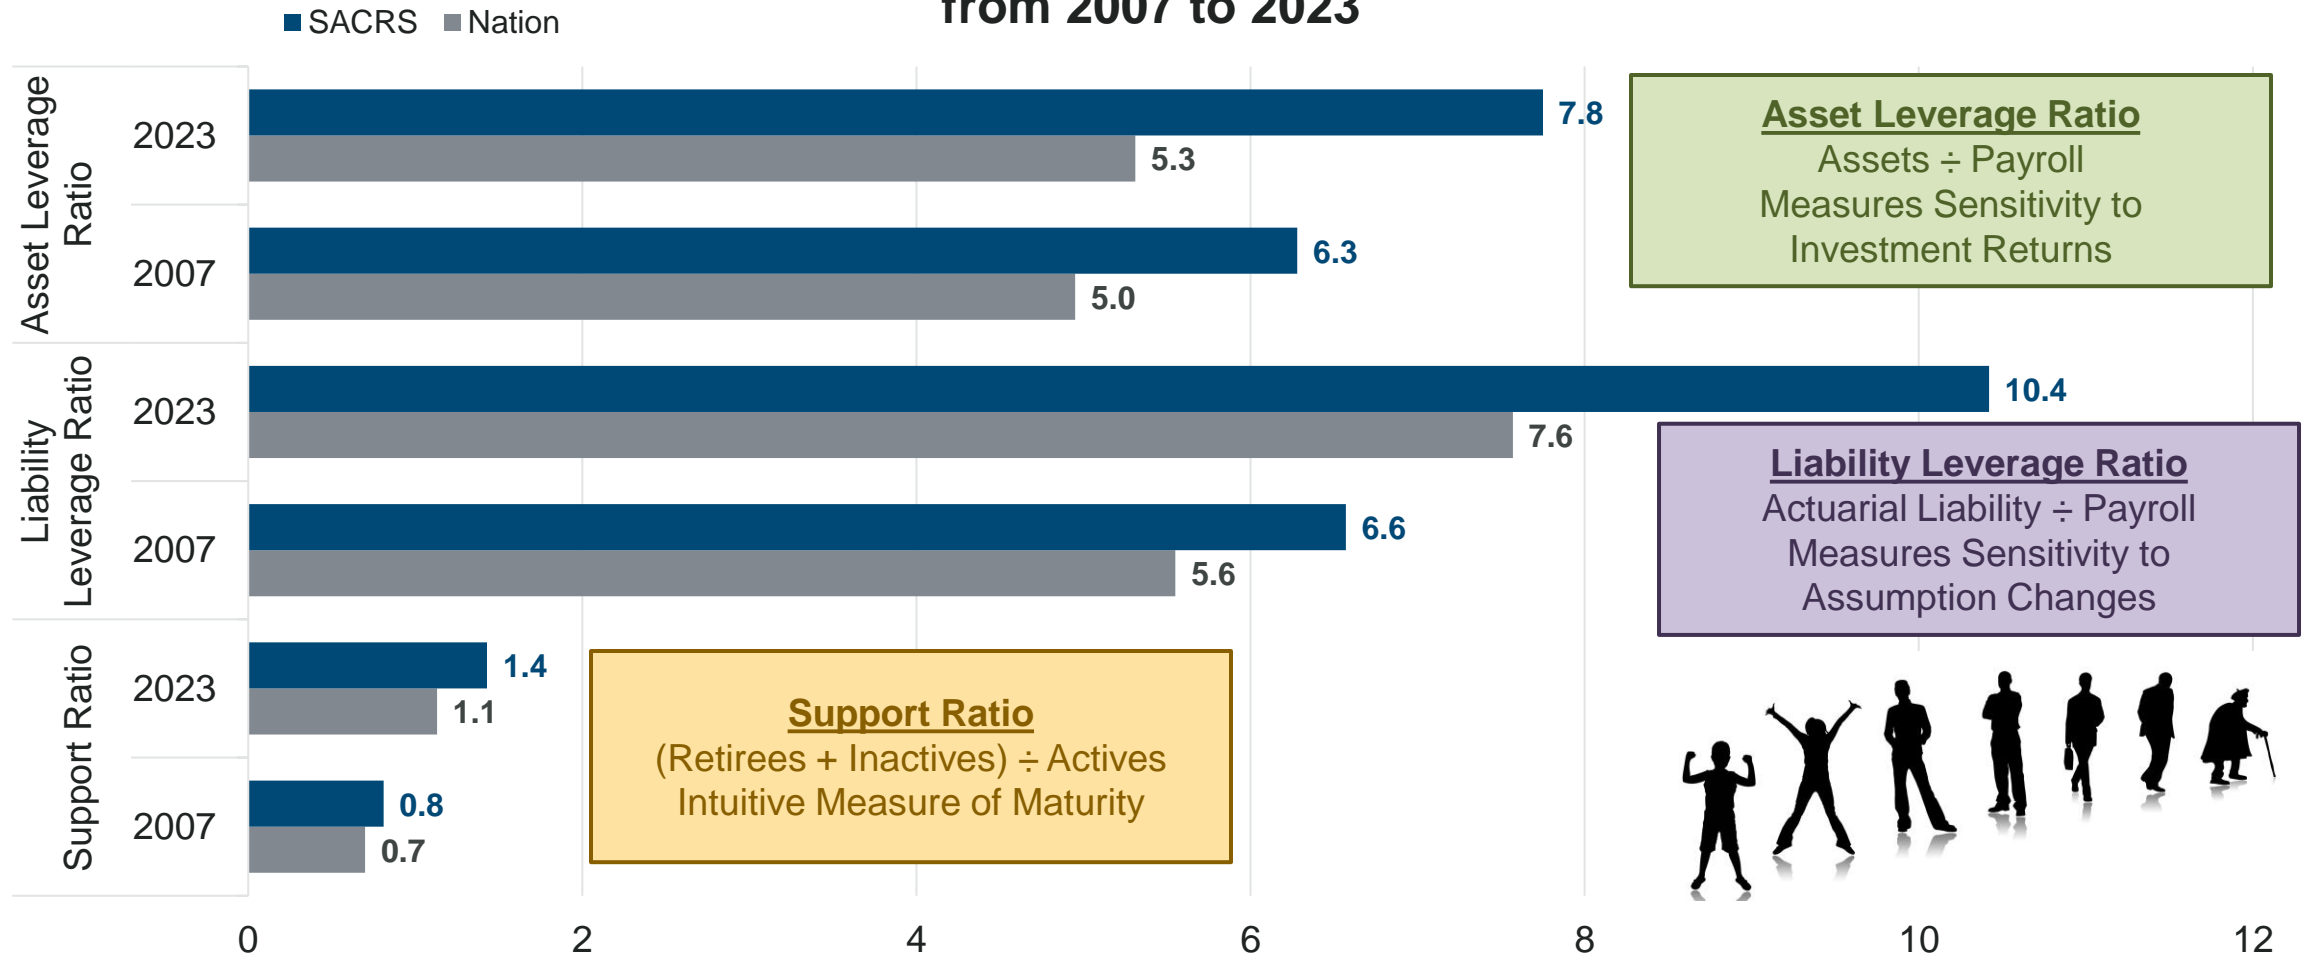

# Sensitivity to Risk - What Are the Risks?

# Maturity Measures Point To More Sensitivity to Risk

## Growth in Median Maturity from 2007 to 2023

# Asset Leverage or Volatility Ratio

Market Value of Assets

Payroll

- Higher ratios lead to higher contribution volatility as a percent of payroll
- What does the Asset Leverage Ratio mean for my Plan?

Example – Assume Plan A and Plan B have the same amount of assets and both plans experience a 10% asset loss and use a discount rate of 7%

Plan	Asset Leverage Ratio	Asset Loss	Asset Loss as a % of Payroll	Increase in UAL Interest Cost as a % of Payroll
Plan A	5	10% loss	50% (5 x 10%)	3.5% (50% x 7%)
Plan B	10	10% loss	100% (10 x 10%)	7.0% (100% x 7%)

# Which Plans Have Higher Asset Leverage Ratios

- What Causes a High Asset Leverage Ratio?
  - **Funding Level** – Better funded plans have higher asset leverage ratios
  - **Maturity** – Plans with more retirees per active have higher asset leverage ratios
  - **Benefit Level** – Plans that provide higher benefits as a percentage of payroll have higher asset leverage ratios

# Typical Asset Allocations Have Changed

# Sensitivity to Risk

Same Plan, Different Time ...

Year	Asset Leverage Ratio	St. Dev. Investment Loss	Investment Loss as a % of Payroll	Increase in Interest Cost as a % of Payroll
National				
2013	4.6	10% loss	46% (4.6 x 10%)	3.6% (46% x 7.75%)
2023	5.3	13% loss	69% (5.3 x 13%)	4.8% (69% x 7.00%)
SACRS				
2013	6.0	10% Loss	60% (6.0 x 10%)	4.6% (60% x 7.625%)
2023	7.8	13% Loss	101% (7.8 x 13%)	6.8% (101% x 6.75%)

# SACRS vs. Nation Scorecard
